<b>Summary and Conclusion</b> .....	17

## ■ Introduction

Juniper Networks SA Series (Juniper SA) allows employees, partners, suppliers and contractors to securely access corporate resources remotely.

Juniper provides three access modes:

- Core – provides access to web-based applications only
- Java-based Secure Application Manager (JSAM) / Windows-based SAM (WSAM) – provides access to other applications in addition to web-based applications
- Network Connect – provides full Layer 3 network access, similar to IPsec

For more information on Juniper SA, visit:

<http://www.juniper.net/us/en/products-services/security/sa-series/>

Adding the AX Series to your Juniper SA deployment provided the following benefits:

- Higher Scalability – enterprises can provide secured remote access to a very high number of employees, load balancing them among multiple Juniper SA devices in parallel.
- High Availability – secured remote access is guaranteed even if a Juniper SA goes offline.
- Higher Security – protects services from DDoS attacks.

This deployment guide contains configuration procedures for AX Series application delivery controllers and server load balancers, to support a Juniper Networks SA Series SSL VPN Appliances solution.

## Prerequisites and Assumptions

- The A10 Networks AX Series device should be running software version 2.2.5 or later.
- It is assumed that readers have some basic configuration familiarity with both the AX Series and Juniper SA.
- Juniper SA screenshots are from Juniper SA release 6.4R1 (build 14063).
- Both IPv4 and IPv6 are supported. The examples in this deployment guide use IPv4.

## 2. AX deployment for Juniper SA

Juniper SA can be installed in two different modes:

- Juniper-SA in-line mode

Figure 1: Juniper SA in-line mode deployment

- Juniper-SA one-arm mode

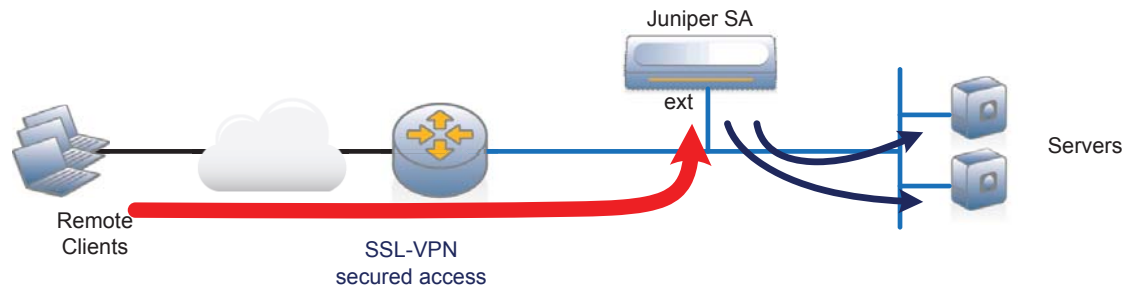

Figure 2: Juniper SA one-arm mode deployment

The AX Series supports each Juniper integration mode and does not require specific configuration depending on mode:

- Juniper-SA in-line mode

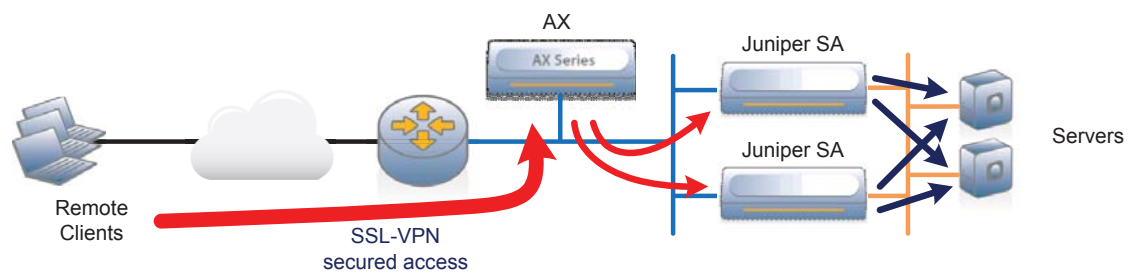

Figure 3: AX one-arm - Juniper SA in-line mode deployment

- Juniper-SA one-arm mode

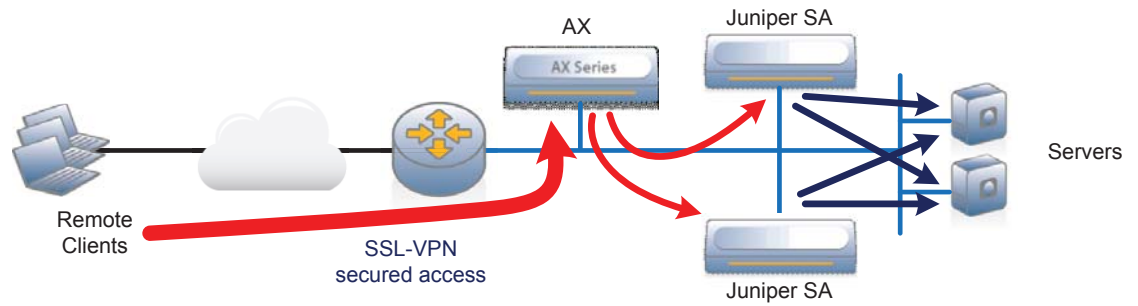

Figure 4: AX one-arm - Juniper SA one-arm mode deployment

Note: The AX Series usually is integrated in one-arm mode (as displayed in the examples above) but can also be installed in routed mode.

## 2.1 Lab diagram

The following diagram shows the network used for the configuration procedures.

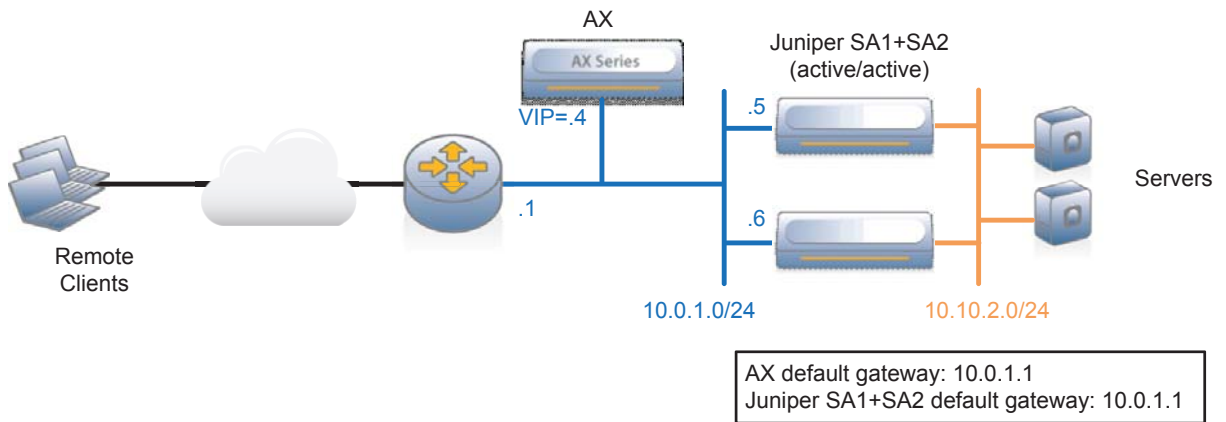

Figure 5: AX – Juniper SA lab diagram

## 2.2 Juniper SA Active-Active configuration

Note: This example shows only the required Juniper SA options. For information about other options, see the Juniper manuals (<http://www.juniper.net/techpubs/software/ive/6.x/6.0>).

### Cluster license validation

Validate Juniper-SA2 has a clustering license (under System > Configuration > Licensing):

1. **Clustering: Allow 50 additional users to be shared from another SA 4500**  
**Key:** kiosk bring spruce harp crucial pinwheel vigor

### Cluster configuration

- Create the Cluster on the Juniper SA.
  - On Juniper-SA1:
    - Create a new cluster, “SA-AX” (under System > Clustering).

**Create New Cluster**

Create

Type: SA-4500

Cluster Name: SA-AX

Cluster Password: ●●●●●●●●

Confirm Password: ●●●●●●●●

Member Name: SA1

Create Cluster

- Add member Juniper-SA2 information (under System > Clustering).

**Add Cluster Member**

Cluster:

Delete

<input type="checkbox"/>	Node Name	Internal IP address	Internal Netmask	Internal Gateway	
<input type="checkbox"/>	SA2	10.0.1.6	255.255.255.0	10.0.1.1	Add
<input type="checkbox"/>					

Save Changes Cancel

- On Juniper-SA2:
  - Join the new cluster SA-AX (under System > Clustering).

### Join Existing Cluster

**Join**

---

Cluster Name:

Cluster Password:

Existing Member Address:

- Validate cluster creation.
  - On Juniper-SA1:
    - Validate that the 2 Juniper SA devices are in the same cluster and in Active/Active mode (under System > Clustering).

*Note: Active/Active mode is the default cluster setting.*

Status
Properties

---

Cluster Name: SA-AX  
 Type: SA-4500  
 Configuration: Active/Active

<input type="checkbox"/>	Member Name	Internal Address	External Address	Status	Notes	Sync Rank	Update
<input type="checkbox"/>	* SA1	10.0.1.5/24		●	Leader	0	<input type="button" value="Update"/>
<input type="checkbox"/>	SA2	10.0.1.6/24		●	Enabled	0	<input type="button" value="Update"/>

\* Indicates the node you are currently using

## 2.3 AX Series configuration

*Note: This example shows only the required AX options. For information about other options, see the AX Series Configuration Guide, the AX Series GUI Reference, or the GUI online help.*

### Create Juniper-SA real servers

- Create a real server for each Juniper-SA. Enter the SA name and IP address, and add the protocol port(s) required for the access modes you plan to allow:
  - TCP 443 – Add TCP port 443 for Core or JSAM/WSAM access.
  - UDP 4500 – Add UDP port 4500 for Network Connect access.
  - Via Web GUI: Config Mode > Service > SLB > Server

**General**

Name: *	SA1
IP Address/Host: *	10.0.1.5 <input checked="" type="radio"/> IPv4 <input type="radio"/> IPv6
GSLB External IP Address:	
Weight:	1

**Port**

Port: \* 4500 Protocol: UDP Weight(W): \* 1  No SSL

Connection Limit(CL): 8000000  Logging Connection Resume(CR):

Server Port Template(SPT): default Stats Data(SD):  Enabled  Disabled

Health Monitor(HM):  (default)  Follow Port: TCP

	Port	Protocol	CL	CR	W	No SSL	SPT	HM	SD
<input checked="" type="checkbox"/>	443	TCP	8000000	<input checked="" type="checkbox"/>	1	<input checked="" type="checkbox"/>	default	(default)	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/>	4500	UDP	8000000	<input checked="" type="checkbox"/>	1	<input checked="" type="checkbox"/>	default	(default)	<input checked="" type="checkbox"/>

Add  
 Update  
 Delete  
 Enable  
 Disable

- Via CLI:
 

```
AX(config)#slb server SA1 10.0.1.5
AX(config-real server)#port 443 tcp
AX(config-real server)#port 4500 udp
```

### Create Juniper-SA health check

- Create a health monitor template to test the availability of the Juniper-SA. Enter the health monitor template name and select type HTTPS. Add URL “/dana-na/healthcheck/healthcheck.cgi” and expected return string “Security gateway is accessible”.

- Via Web GUI: Config Mode > Service > Health Monitor

Health Monitor		
Name: *	hm-sa	
Retry:	3	
Consec Pass Req'd:	1	
Interval:	5	Seconds
Timeout:	5	Seconds
Strictly Retry:	<input type="checkbox"/>	
Disable After Down:	<input type="checkbox"/>	
Method		
Override IPv4:		
Override IPv6:		
Override Port:		
Method:	<input checked="" type="radio"/> Internal <input type="radio"/> External	
Type:	HTTPS	
Port:	443	
Host:		
URL:	GET /dana-na/healthche	
User:		
Password:		
Expect:	Security gateway is accessible <input checked="" type="radio"/> Text <input type="radio"/> Code	
Maintenance Code:		

- Via CLI:
 

```
AX(config)#health monitor hm-sa
AX(config-health:monitor)#method https url GET /dana-na/healthcheck/healthcheck.cgi expect "Security gateway is accessible"
```

## Create Juniper-SA service groups

Separate service groups are required. If you plan to allow Core or JSAM/WSAM access, you need a TCP service group. For Network Access mode, you also need a UDP group.

- Create a TCP service group for SSL traffic. Enter a name for the service group, select TCP from the Type drop-down list, select the load balancing algorithm least connection, and select the SA health monitor. Assign each Juniper SA to the service group.

- Via Web GUI: Config Mode > Service > SLB > Service Group

**Service Group**

Name: \* SA-Fam-SSL

Type: TCP

Algorithm: Least Connection

Health Monitor: hm-sa

Min Active Members:

Send client reset when server selection fails

Stats Data:  Enabled  Disabled

Description:

---

**Server**

IPv4/IPv6:  IPv4  IPv6

Server: \* SA2

Port: \* 443

Server Port Template(SPT): default

Priority: 1

Stats Data:  Enabled  Disabled

<input type="checkbox"/>	Server	Port	SPT	Priority	Stats Data
<input checked="" type="checkbox"/>	SA1	443	default	1	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/>	SA2	443	default	1	<input checked="" type="checkbox"/>

- Via CLI:
 

```
AX(config)#slb service-group SA-Farm-SSL tcp
AX(config-slb svc group)#method least-connection
AX(config-slb svc group)#health-check hm-sa
AX(config-slb svc group)#member SA1:443
AX(config-slb svc group)#member SA2:443
```

- Create a UDP service group for UDP traffic (Network Connect). Enter a name for the service group, select UDP from the Type drop-down list, and select the load balancing algorithm least connection. Assign each Juniper SA to the service group.

- Via Web GUI: Config Mode > Service > SLB > Service Group

**Service Group**

Name: *	SA-Fam-NC		
Type:	UDP		
Algorithm:	Least Connection		
Health Monitor:			
Min Active Members:	<input type="checkbox"/>		
Stats Data:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled		
Description:			

**Server**

IPv4/IPv6:  IPv4  IPv6

Server: \* SA2 Port: \* 4500

Server Port Template(SPT): default Priority: 1

Stats Data:  Enabled  Disabled

<input type="checkbox"/>	Server	Port	SPT	Priority	Stats Data
<input checked="" type="checkbox"/>	SA1	4500	default	1	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/>	SA2	4500	default	1	<input checked="" type="checkbox"/>

- Via CLI:
 

```
AX(config)#slb service-group SA-Farm-NC udp
AX(config-slb svc group)#method least-connection
AX(config-slb svc group)#member SA1:4500
AX(config-slb svc group)#member SA2:4500
```

## Create Juniper-SA persistency

- Create a source IP persistence template to guarantee each end user will always go to the same Juniper-SA. This is required regardless of the access modes supported (Core, JSAM/WSAM, Network Connect). Enter the persistence template name and select match type server.
  - Via Web GUI: Config Mode > Service > Template > Persistent > Source IP Persistence

**Source IP Persistence**

Name: *	persist-sa	
Match Type:	Server	<input type="checkbox"/> Scan All Members
Timeout:	5	Minutes
Don't Honor Conn Rules:	<input type="checkbox"/>	
Netmask:	255.255.255.255	

- Via CLI:
 

```
AX(config)#slb template persist source-ip persist-sa
AX(config-source ip persist)#match-type server
```

## Create IP Source-NAT Pool

- Create a source NAT pool to guarantee the Juniper-SA traffic back to the end users will go through the AX device. Enter the source NAT template name, select the first and last IP addresses used to SNAT the traffic (one IP address can be used for up to 64 k flows), and select the subnet of that SNAT pool.
  - Via Web GUI: Config Mode > Service > IP Source NAT

IPv4 Pool	
Name: *	snat-sa
Start IP Address: *	10.0.1.200
End IP Address: *	10.0.1.200
Netmask: *	255.255.255.0
Gateway:	
HA Group:	

- Via CLI: AX(config)# ip nat pool snat-sa 10.0.1.200 10.0.1.200 netmask /24

## Create Juniper-SA VIP

- Create the virtual IP address (VIP), which is the IP address that end users will access.
  - Enter a name for the VIP, and enter the IP address.
    - Via Web GUI: Config Mode > Service > SLB > Virtual Server

General	
Name: *	SA <input type="checkbox"/> Wildcard
IP Address or CIDR Subnet: *	10.0.1.4 <input checked="" type="radio"/> IPv4 <input type="radio"/> IPv6
Status:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled

- Via CLI: AX(config)#slb virtual-server SA 10.0.1.4

- For Core or JSAM/WSAM access, add TCP port 443 and select the service group, SNAT pool, and persistence template.
  - Via Web GUI: Config Mode > Service > SLB > Virtual Server > Port

Virtual Server Port	
Name:	SA
Type: *	TCP
Port: *	443
Service Group:	SA-Farm-SSL
Connection Limit:	<input type="checkbox"/> 8000000 <input checked="" type="radio"/> Drop <input type="radio"/> Reset <input checked="" type="checkbox"/> Logging
<input checked="" type="checkbox"/>	Use default server selection when preferred method fails
<input type="checkbox"/>	Use received hop for response
<input type="checkbox"/>	Send client reset when server selection fails
Status:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
HA Connection Mirror:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Direct Server Return:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
SYN Cookie:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Stats Data:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Source NAT traffic against VIP:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Virtual Server Port Template:	default
Access List:	
Source NAT Pool:	snat-sa
aFlex:	
TCP Template:	
Persistence Template Type:	Source IP Persistence Template
Source IP Persistence Template:	persist-sa

- Via CLI:
 

```
AX(config-slb vserver)#port 443 tcp
AX2(config-slb vserver-vport)#service-group SA-Farm-SSL
AX2(config-slb vserver-vport)#source-nat pool snat-sa
AX2(config-slb vserver-vport)#template persist source-ip
persist-sa
```

- For Network Connect access, add UDP port 4500 and select the service group, SNAT pool, and persistence template.
  - Via Web GUI: Config Mode > Service > SLB > Virtual Server > Port

Virtual Server Port	
Name:	SA
Type: *	UDP
Port: *	4500
Service Group:	SA-Farm-NC
Connection Limit:	<input type="checkbox"/> 8000000 <input checked="" type="radio"/> Drop <input type="radio"/> Reset <input checked="" type="checkbox"/> Logging
<input checked="" type="checkbox"/>	Use default server selection when preferred method fails
<input type="checkbox"/>	Use received hop for response
Status:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
HA Connection Mirror:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Direct Server Return:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Stats Data:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Source NAT traffic against VIP:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Virtual Server Port Template:	default
Access List:	
Source NAT Pool:	snat-sa
aFlex:	
UDP Template:	
Source IP Persistence Template:	tp-ip-pers1

- Via CLI:
 

```
AX(config-slb vserver)#port 4500 udp
AX2(config-slb vserver-vport)#service-group SA-Farm-NC
AX2(config-slb vserver-vport)#source-nat pool snat-sa
AX2(config-slb vserver-vport)#template persist source-ip
persist-sa
```

## 2.4 Validate AX configuration

Display the status of the VIP and its members.

- Via Web GUI: Config Mode > Service > SLB > Virtual Server

	Name	Connections		Packets		Bytes	
		Current	Total	Forward	Reverse	Forward	Reverse
SA/10.0.1.4		0	0	0	0	0	0
TCP/443		0	0	0	0	0	0
443 (SA1)		0	0	0	0	0	0
443 (SA2)		0	0	0	0	0	0
UDP/4500		0	0	0	0	0	0
4500 (SA1)		0	0	0	0	0	0
4500 (SA2)		0	0	0	0	0	0

- Via CLI: AX#show slb virtual-server SA  
AX#show slb service-group [SA-Farm-SSL | SA-Farm-NC]  
AX#show slb server [SA1 | SA2]

## 2.5 AX / Juniper SA deployment validation

To validate the AX deployment:

- Verify that clients can access the Juniper SA farm using the access modes authorized through the VIP:
  - Core
  - JSAM/WSAM
  - Network Connect
- Validate both the Juniper SA devices receive traffic from different clients.

*Note: You must have multiple end users concurrently connected.*

## ■ Summary and Conclusion

The AX Series Advanced Traffic Manager enhances Juniper SA load balancing by providing:

- High availability
- High scalability
- High flexibility
- High performance
- High security

## About A10 Networks

A10 Networks was founded in 2004 with a mission to provide innovative networking and security solutions. A10 Networks makes high-performance products that help organizations accelerate, optimize and secure their applications. A10 Networks is headquartered in Silicon Valley with offices in the United States and centers of excellence around the globe. For more information, visit [www.a10networks.com](http://www.a10networks.com).

### Performance by Design

To learn more about the AX Series Advanced Traffic Manager and how to improve application performance up to 8 times faster while enhancing reliability and security, visit A10 Networks' website at: [www.a10networks.com](http://www.a10networks.com)  
**Or call and talk to an A10 sales representative:**
